**Condition C reconstruction in German A'-movement: experimental results** Doreen Georgi (Potsdam) – Martin Salzmann (Leipzig) – Marta Wierzba (Potsdam)

doreen.georgi@uni-potsdam.de – martin.salzmann@uni-leipzig.de – marta.wierzba@uni-potsdam.de

## Background

### **Previous theoretical claims on Condition C reconstruction in English:**

- argument-adjunct asymmetry: only R-expressions inside arguments trigger Condition C effects, R-expressions inside adjuncts don't (Freidin 1986, Lebeaux 1988, Fox 1999, Safir 1999)
- predicate-argument asymmetries (Huang 1993, Heycock 1995): predicates obligatorily reconstruct, arguments do not; Condition C effects decrease with increasing distance between R-expression/pronoun under embedding with arguments but not with predicates
- movement-type asymmetry (Munn 1994, Citko 2001, Sauerland 1998, 2003): relative clauses display weaker Condition C effects than wh-movement

### **Previous empirical claims:**

- English: Condition C effects under A'-movement questioned quite generally; experimental work (Adger et al. 2017, Bruening & Al Khalaf 2018): Condition C effects systematic only with adjectival predicates, but partially absent with nominal arguments; only weak argument-adjunct asymmetry.
- German: Principle C effects are robust in wh-movement/topicalization but weak/absent in relativization (Salzmann 2006, 2017)

### Our contribution: 1st experimental investigation of Condition C reconstruction in German A'-movement.

## Method and participants

Mary tells us how proud of Anna she is.

forced-choice task, inspired by Bruening and Al Khalaf (2018):

web-based questionnaires (SoSci Survey, Prolific)

Can this sentence be interpreted such that				
Mary is proud? (Q1)	$\Box$ Yes	$\Box$ No		
Anna is proud? (Q2)	$\Box$ Yes	$\Box$ No		

provide two potential referents (in local/higher clause)

in situ

moved

in situ

moved

- innovation: we explicitly asked for each of the readings whether
  - it is possible or not  $\rightarrow$  optionality can be captured
- ▶ five experiments, 32/48/36/36/32 participants
- Latin Square Design
- ▶ 1:1 items-fillers ratio

# **Design and stimuli**

### **Factors:**

- 2. DPs (arguments) vs. APs (predicates) 1. in situ vs. moved
- 3. R-expression inside argument vs. R-expression inside adjunct (DP-arguments only)
- 4. distance between pronoun and R-expression (linear and structural)
- 5. wh-movement vs. relativization

## **Sample item set:** (see handout for original German items)

### APs (predicates) (1)

- Mary tells (us) that she is very proud of Anna (and the teams).
- Mary tells (us) [ how proud of Anna (and the teams) ] she is \_\_\_\_\_. b. Principle C predicts: coreference between *she* and *Anna* impossible.

#### (2)DPs – R-expression inside argument

- Mary tells (us) that she saw a statue of Anna.
- Mary tells (us) [which statue of Anna] she saw \_. b.

Principle C predicts: coreference between *she* and *Anna* impossible

Additional factors:				
(3)	DPs	– R-expression inside adjunct		
	a. b.	Mary tells (us) that she saw a statue on the desk of Anna.inMary tells (us) [ which statue on the desk of Anna ] she sawmodelLate merger predicts: coreference between she and Anna is possiblemodel	situ oved	
(4)	structural distance – R-expression and pronoun clause-mates?			
	<ul> <li>a. Mary tells (us) [ which statue of Anna ] she thinks that you saw emb</li> <li>b. Mary tells (us) [ which statue of Anna ] you think that she saw emb</li> <li>Ellipsis predicts: R-expression in antecedent can correspond to pronoun in ellipsis s</li> <li>Vehicle Change approach (Safir 1999) predicts: Principle C effect vanishes with not</li> <li>&amp; adjectives; 'embedding 2': Principle B effect arises with adjectives (not with not</li> </ul>		nb 1 nb 2 site ouns uns)	
(5)	wh-movement vs. relativization:			
	a. b.	Peter mentioned [ which statue of Robert ] he sawwh-movenPeter mentioned [ every statue of Robert ] which he sawrelativization	nent ation	

## **Results and Discussion**

### Wh-movement – adjectival predicates:

### Wh-movement – nouns:

### Main findings on wh-movement:

- reconstruction for Principle C is very robust, with both adjectival predicates and nouns
- no support for predicted argument-adjunct asymmetry.
- $\rightarrow$  argues against a late-merger approach to adjuncts
- no significant effect of linear distance
- significant effect of embedding
- pattern goes against predictions of Vehicle Change approach

University of Oslo, 10 May 2019

### Summary: robust reconstruction for Principle C in wh-movement, less robust in relativization; no pred-arg-asymmetry; no arg-adj-asymmetry

- movement-type-asymmetry: argues for a full representation of the antecedent of wh-movement in the bottom position and for the Matching analysis (with optional) deletion/vehicle change of the lower copy) of RCs  $\rightarrow$  no full instance of the external head inside the RC
- no arg-adj-asymmetry: argues against late merger approaches to adjunction; no pred-arg-asymmetry: argues against a silent PRO/a trace of the subject in predicates embedding effect: suggests that non-syntactic factors play an important role as well
- $\triangleright$  more robust Condition C reconstruction than in recent experimental work on English  $\rightarrow$  due to different methods, or differences between the languages?
- the results for long-distance relativization (marked strategy) are similar to those for prolepsis (unmarked strategy, part of the fillers) (Salzmann 2006, 2017).
